[EAR] High Grade Gold Intercepts at Julius Gold Deposit.

24-Jun-2008

Echo Resources Limited has announced that sample assay results have been received for the first batch of Reverse Circulation samples from drilling completed at the Julius Gold Deposit within March this year.

The results have shown high-grade gold-bearing zones recorded in fresh granite rocks at vertical depths which indicate the potential of the granitic rocks to the east and below Julius to host high grade gold mineralisation.

Further assay results are expected from the remaining holes in July 2008.
